BEST DAY	\$+450 (Aug 06)
WORST DAY	\$-495 (Aug 07)

Realized P&L = winning-side contracts x \$1 - cost - fees, per settled market (accounts for intra-game YES/NO netting). Equity = starting account value + deposits + REALIZED P&L (open positions excluded until they settle). Returns normalized for deposits: daily return = P&L / capital-invested-to-date; Sharpe annualized x sqrt(252). Generated 2026-08-12 21:43 from the Kalshi API. All dollar values NORMALIZED to a \$1,000 capital base; ratios (ROI, Sharpe, win rate) are actual.
